| | Mathematica | al Practices | |
| 1. Make sense of problems and persevere in solving them. | | 5. Use appropriate tools strategically. | |
| 2. Reason abstractly and quantitatively. | | 6. Attend to precision. | |
| 3. Construct viable arguments and critique the reasoning of others. | | 7. Look for and make use of structure. | |
| 4. Model with mathematics. | | 8. Look for and express regularity in repeat | ted reasoning. |
| | | | |

All quarters will include the Mathematical Practices

NOTE: Mathematical practices are interwoven and should be addressed throughout the year in as many different units and tasks as possible in order to stress the natural connections that exist among mathematical topics.

Grade 2 Key: OA = Operations and Algebraic Thinking, NBT = Number and Operations in Base Ten, MD = Measurement and Data, G = Geometry

Second Grade Overview

Operations and Algebraic Thinking (OA)

- Represent and solve problems involving addition and subtraction.
- Add and subtract within 20.
- Work with equal groups of objects to gain foundations for multiplication.

Number and Operations in Base Ten (NBT)

- Understand place value.
- Use place value understanding and properties of operations to add and subtract.

Measurement and Data (MD)

- Measure and estimate lengths in standard units.
- Relate addition and subtraction to length.
- Work with time and money.
- Represent and interpret data.

Geometry (G)

• Reason with shapes and their attributes.

Standards for Mathematical Practices (MP)

- 1. Make sense of problems and persevere in solving them.
- 2. Reason abstractly and quantitatively.
- 3. Construct viable arguments and critique the reasoning of others.
- 4. Model with mathematics.
- 5. Use appropriate tools strategically.
- 6. Attend to precision.
- 7. Look for and make use of structure.
- 8. Look for and express regularity in repeated reasoning.

Mathematics - Second Grade

Second Grade Content Emphasis

| Second Grade Content Emphasis | | |
|---|--|--|
| Operations and Algebraic Thinking (OA) | | |
| Represent and solve problems involving addition and subtraction. | | |
| Add and subtract within 20. | | |
| Work with equal groups of objects to gain foundations for multiplication. | | |
| Number and Operations in Base Ten (NBT) | | |
| Understand place value. | | |
| Use place value understanding and properties of operations to add and subtract. | | |
| Measurement and Data (MD) | | |
| Measure and estimate lengths in standard units. | | |
| Relate addition and subtraction to length. | | |
| Work with time and money. | | |
| Represent and interpret data. | | |
| Geometry (G) | | |
| Reason with shapes and their attributes. | | |
| -Major Content _ Supporting Content | | |
| Major content (🛑) from the content emphasis section should account for approximately 70% of instructional time. | | |

Quarter 1

Essential Question(s):

- What strategies can I use to add and subtract?
- How can equal groups help me add?
- How can I use place value?

80% of instructional time should be based on core materials (My Math, Go Math, Saxon); 20% may be based on additional resources.

| Topic | Arizona Mathematics Standards | Resources |
|--|---|---|
| Fluency Standard | To be taught throughout the year: 2.OA.B.2 Fluently add and subtract within 20. By the end of Grade 2, know from memory all sums of two one- digit numbers. | |
| Apply Addition and Subtraction Concepts | 2.OA.A.1 Use addition and subtraction within 100 to solve one- and two-step word problems. Represent a word problem as an equation with a symbol for the unknown. See Table 1. 2.OA.B.2 Fluently add and subtract within 20. By the end of Grade 2, know from memory all sums of two one-digit numbers. | My Math Chapter 1 Additional Resources: Illustrative Mathematics <u>2.OA.A.1 Tasks</u> <u>2.OA.B.2 Tasks</u> Georgia Standards – <u>Unit 2</u> Inside Mathematics 2nd Grade OA Tasks |
| Number Patterns | 2.OA.C.3 Determine whether a group of objects (up to 20) has an odd or even number of members (e.g., by pairing objects or counting them by 2's). 2.OA.C.4 Use addition to find the total number of objects arranged in rectangular arrays (with up to 5 rows and 5 columns). Write an equation to express the total as a sum of equal addends. 2.NBT A 2 Count within 1000: skip count by 5's 10's and 100's | My Math Chapter 2 Additional Resources: EngageNY Module 6 <u>Topic A</u> <u>Topic B</u> |

| Essential | Question | (s) |): |
|-----------|----------|-----|----|
| Losential | question | 13 | |

• What strategies can I use to add and subtract?

>, =, and < symbols to record the results of comparisons.

How can equal groups help me add?
How can I use place value?
Place Value to 1,000
2.NBT.A.1 Understand that the three digits of a three-digit number represent groups of hundreds, tens, and ones (e.g., 706 equals 7 hundreds, 0 tens, and 6 ones and also equals 70 tens and 6 ones). Understand the following as special cases:

a. 100 can be thought of as a group of ten tens—called a "hundred."
b. The numbers 100, 200, 300, 400, 500, 600, 700, 800, 900 refer to one, two, three, four, five, six, seven, eight, or nine hundreds (and 0 tens and 0 ones).
2.NBT.A.2 Count within 1000; skip count by 5's, 10',s and 100's.
2.NBT.A.3 Read and write numbers up to 1000 using base-ten numerals, number names, and expanded form.
2.NBT.A.4 Compare two three-digit numbers based on meanings of the hundreds, tens, and ones digits, using

*The Standards for Mathematical Practices are to be embedded throughout every chapter.

| | 2.MD.D.9 Generate measurement data by measuring lengths of several objects to the nearest whole unit, or by making repeated measurements of the same object. Show the measurements by making a line plot, where the horizontal scale is marked off in whole-number units. | 2 nd Grade MD Tasks | |
| *The Standards for Mathematical Practices are to be embedded throughout every chapter. | | | |

| Mathematics Practices | | Narratives | Related Questions |
|---|---|--|---|
| Overarching habits of mind of a productive math thinker | 4.MP.1 Make sense of problems and persevere in solving them | Mathematically proficient students explain to themselves the meaning of a problem, look for entry points to begin work on the problem, and plan and choose a solution pathway. While engaging in productive struggle to solve a problem, they continually ask themselves, "Does this make sense?" to monitor and evaluate their progress and change course if necessary. Once they have a solution, they look back at the problem to determine if the solution is reasonable and accurate. Mathematically proficient students check their solutions to problems using different methods, approaches, or representations. They also compare and understand different representations of problems and different solution pathways, both their own and those of others. | How would you describe the problem in your own words? How would you describe what you are trying to find? What do you notice about? What information is given in the problem? Describe the relationship between the quantities. Describe what you have already tried. What might you change? Talk me through the steps you've used to this point. What steps in the process are you most confident about? What are some other strategies you might try? What are some other problems that are similar to this one? How might you use one of your previous problems to help you begin? How else might you organizerepresent show? |
| | 4.MP.6 Attend to precision | Mathematically proficient students clearly communicate to others using appropriate mathematical terminology, and craft explanations that convey their reasoning. When making mathematical arguments about a solution, strategy, or conjecture, they describe mathematical relationships and connect their words clearly to their representations. Mathematically proficient students understand meanings of symbols used in mathematics, calculate accurately and efficiently, label quantities appropriately, and record their work clearly and concisely. | What mathematical terms apply in this situation? How did you know your solution was reasonable? Explain how you might show that your solution answers the problem. What would be a more efficient strategy? How are you showing the meaning of the quantities? What symbols or mathematical notations are important in this problem? What mathematical language,definitions, properties can you use to explain? How could you test your solution to see if it answers the problem? |

| Mathematics Practices | | Narratives | Related Questions | |
|--------------------------|--|---|--|--|
| Reasoning and Explaining | 4.MP.2 Reason abstractly and quantitatively | Mathematically proficient students make sense of quantities and their relationships in problem situations. Students can contextualize and decontextualize problems involving quantitative relationships. They contextualize quantities, operations, and expressions by describing a corresponding situation. They decontextualize a situation by representing it symbolically. As they manipulate the symbols, they can pause as needed to access the meaning of the numbers, the units, and the operations that the symbols represent. Mathematically proficient students know and flexibly use different properties of operations, numbers, and geometric objects and when appropriate they interpret their solution in terms of the context. | What do the numbers used in the problem represent? What is the relationship of the quantities? How is related to? What is the relationship between and? What doesmean to you? (e.g. symbol, quantity, diagram) What properties might we use to find a solution? How did you decide in this task that you needed to use? Could we have used another operation or property to solve this task? Why or why not? | |
| | 4.MP.3 Construct viable arguments and critique the reasoning of others | Mathematically proficient students construct mathematical arguments (explain the reasoning underlying a strategy, solution, or conjecture) using concrete, pictorial, or symbolic referents. Arguments may also rely on definitions, assumptions, previously established results, properties, or structures. Mathematically proficient students make conjectures and build a logical progression of statements to explore the truth of their conjectures. They are able to analyze situations by breaking them into cases, and can recognize and use counterexamples. Mathematically proficient students present their arguments in the form of representations, actions on those representations, and explanations in words (oral or written). Students critique others by affirming or questioning the reasoning of others. They can listen to or read the reasoning of others, decide whether it makes sense, ask questions to clarify or improve the reasoning, and validate or build on it. Mathematically proficient students can communicate their arguments in response to the critiques of others. | What mathematical evidence would support your solution? How can we be sure that? / How could you prove that? Will it still work if? What were you considering when? How did you decide to try that strategy? How did you test whether your approach worked? How did you decide what the problem was asking you to find? Did you try a method that did not work? Why didn't it work? Could it work? What is the same and what is different about? How could you demonstrate a counter-example? | |

| Mathematics Practices | | Narratives | Related Questions |
|--------------------------|--|--|---|
| Modeling and Using Tools | 4.MP.4 Model with mathematics | Mathematically proficient students apply the mathematics they know to solve problems arising in everyday life, society, and the workplace. When given a problem in a contextual situation, they identify the mathematical elements of a situation and create a mathematical model that represents those mathematical elements and the relationships among them. Mathematically proficient students use their model to analyze the relationships and draw conclusions. They interpret their mathematical results in the context of the situation and reflect on whether the results make sense, possibly improving the model if it has not served its purpose. | What number model could you construct to represent the problem? What are some ways to represent the quantities? What is an equation or expression that matches the diagram, number line, chart, table, and your actions with the manipulatives? Where did you see one of the quantities in the task in your equation or expression? What does each number in the equation mean? How would it help to create a diagram, graph, table? What are some ways to visually represent? What formula might apply in this situation? |
| | 4.MP.5 Use appropriate tools strategically | Mathematically proficient students consider available tools when solving a mathematical problem. They choose tools that are relevant and useful to the problem at hand. Proficient students are sufficiently familiar with tools appropriate for their grade or course to make sound decisions about when each of these tools might be helpful, recognizing both the insight to be gained and their limitations. Students deepen their understanding of mathematical concepts when using tools to visualize, explore, compare, communicate, make and test predictions, and understand the thinking of others. | What mathematical tools can we use to visualize and represent the situation? Which tool is more efficient? Why do you think so? What information do you have? What do you know that is not stated in the problem? What approach are you considering trying first? What estimate did you make for the solution? In this situation would it be helpful to usea graph, number line, ruler, diagram, calculator, manipulative? Why was it helpful to use? What can using a show us thatmay not? In what situations might it be more informative or helpful to use? |

| Mathematics Practices | | Narratives | Related Questions |
|-----------------------------------|--|--|--|
| Seeing structure and generalizing | 4.MP.7 Look for and make use of structure | Mathematically proficient students use structure and patterns to assist in making connections among mathematical ideas or concepts when making sense of mathematics. Students recognize and apply general mathematical rules to complex situations. They are able to compose and decompose mathematical ideas and notations into familiar relationships. Mathematically proficient students manage their own progress, stepping back for an overview and shifting perspective when needed. | What observations do you make about? What do you notice when? What parts of the problem might you eliminate, simplify? What patterns do you find in? How do you know if something is a pattern? What ideas that we have learned before were useful in solving this problem? What are some other problems that are similar to this one? How does this relate to? In what ways does this problem connect to other mathematical concepts? |
| | 4.MP.8 Look for and express regularity in repeated reasoning | Mathematically proficient students look for and describe regularities as they solve multiple related problems. They formulate conjectures about what they notice and communicate observations with precision. While solving problems, students maintain oversight of the process and continually evaluate the reasonableness of their results. This informs and strengthens their understanding of the structure of mathematics which leads to fluency. | Explain how this strategy works in other situations? Is this always true, sometimes true or never true? How would we prove that? What do you notice about? What is happening in this situation? What would happen if? Is there a mathematical rule for? What predictions or generalizations can this pattern support? What mathematical consistencies do you notice? |

Chandler Unified School District #80 Revised: January 2018

Mathematics - Second Grade Table 2. Common Multiplication and Division Situations.⁷

| | Unknown Product | Group Size Unknown | Number of Groups Unknown |
|---------------------------|--|---|--|
| | | ("How many in each group?" Division) | ("How many groups?" Division) |
| | 3 x 6 = ? | 3 x ? = 18, and 18 ÷ 3 = ? | ? x 6 = 18, and 18 ÷ 6 = ? |
| | There are 3 bags with 6 plums in each bag. How many plums are there in all? | If 18 plums are shared equally into 3 bags, then how many plums will be in each bag? | If 18 plums are to be packed 6 to a bag, then how many bags are needed? |
| Equal Groups | Measurements example: | Measurement example: | Measurement example: |
| | You need 3 lengths of string, each 6 inches long. How much string will you need altogether? | You have 18 inches of string, which you will cut into 3 equal pieces. How long will each piece of string be? | You have 18 inches of string, which you will cut into pieces that are 6 inches long. How many pieces of string will you have? |
| | There are 3 rows of apples with 6 apples in each row. How many apples are there? | If 18 apples are arranged into 3 equal rows, how many apples will be in each row? | If 18 apples are arranged into equal rows of 6 apples, how many rows will there be? |
| Arrays ^₄ | What is the area of a 3 cm by 6 cm rectangle? | Area example: A rectangle has the area 18 square | Area example: A rectangle has the area 18 square |
| | | long is a side next to it? | how long is a side next to it? |
| | A blue hat costs \$6. A red hat costs 3 times as much as the blue hat. How much does the red hat cost? | A red hat costs \$18 and that is 3 times as much as a blue hat costs. How much does a blue hat cost? | A red hat costs \$18 and a blue hat costs \$6. How many times as much does the red hat cost as the blue hat? |
| Compare (Grade 4 ONLY) | Measurement example: | Measurement example: | Measurement example: |
| | A rubber band is 6 cm long. How long will the rubber band be when it is stretched to be 3 times as long? | A rubber band is stretched to be 18 cm long and that is 3 times as long as it was at first. How long was the rubber band at first? | A rubber band was 6 cm long at first. Now it is stretched to be 18 cm long. How many times as long is the rubber band now as it was at first? |
| General | a x b = ? | a x ? = p, and p ÷ a = ? | ? x b = p, and p ÷ b = ? |

⁷ The first examples in each cell are examples of discrete things. These are easier for students and should be given before the measurement examples.

⁴ The language is the array examples shows the easiest form of array problems. A harder form is to use the terms rows and columns: The apples in the grocery window are in 3 rows and 6 columns. How many apples are in there? Both forms are valuable.
