1.	Think back to what we learned about sound. Can humans hear ALL sound frequencies?
2.	Do all sounds (even the ones we can't hear) travel at the same speed in the same medium?
3.	Which travels faster – light or sound?
	Just like we, as humans, are "deaf" to a large portion of the sound wave spectrum, we (humans) can only see with our eyes a TINY portion of the electromagnetic (EM) spectrum. We are "blind" to the rest. What do you think the portion we CAN see is called?
	According to Einstein's theory of the photo electric effect, light consists of particles (massless bundles of concentrated energy) which we now call (*hint – look a

NAME:______DATE:_____CLASS:_____

Check your chart on the previous page with the correct one on this page – fix any errors you might have!

- **8.** Which electromagnetic (EM) wave on the above spectrum has the LARGEST wavelength?_____
- **9.** Which EM wave on the above spectrum has the SMALLEST *wavelength?*
- **10.** Which EM wave on the above spectrum has the HIGHEST *frequency?*
- 11. Which EM wave on the above spectrum has the LOWEST frequency?______
- **12.** Are wavelength and frequency DIRECTLY or INVERSELY proportional? _____
- **13.** Which EM wave on the above spectrum has the MOST *energy?*

(hint – use any prior knowledge or experience):
	Your friend says that microwaves and ultraviolet light have different wavelengths but travel through pace at the same speed. Do you agree or disagree? EXPLAIN:
16. -	Why don't you notice light "traveling" to you from a light bulb after you flip the "on" switch?
	Your friend says that any radio wave travels MUCH faster than any sound wave. Do you agree or isagree, and why? (*Hint – check #4 on this POGIL)
18.	Where does sound fit on the EM spectrum (or does it????) Explain:
est	<i>laves in Our Everyday Lives:</i> Read each piece of info and answer the ions
entl ve a	ansportation Safety Administrationthe airport security people) y introduced 2 types of controversial imaging technology, millimeter and backscatter. Millimeter wave technology (photo on left) bounces high frequency radio waves off the body to create a black and white three-
•	dimensional image. The technology emits 10,000 times less radio frequency energy than the average cell phone. Backscatter x-ray technology (on the right) uses low frequency x-rays.
	Based on what you know about EM waves, to which one of these security devices would
y	ou rather be exposed? <u>Why</u> ?

Some real world information about EM waves...

- Radio waves: used mainly for satellite communication purposes (has your Blackberry ever had no signal and has said "Radio Off"? That is because it is unable to communicate with the satellite responsible for transmitting network signals via radio waves). Also used for RADAR.
- Microwaves: also used for satellites communication (for radios, phones, TV signals, etc) through space; used for cooking
- <u>Infrared:</u> Certain medical equipment can create an "infrared photo" (thermogram) of the blood circulation within your body this thermogram can be used to diagnose certain diseases. Night vision goggles are able to detect infrared waves, too. Your TV remote control uses infrared, as do portable gaming systems that can "link up" wirelessly with one another. also, the 'face detection' technology in digital cameras relies on infrared more on that later this unit!
- Visible Light: it's all we can see!
- <u>Ultraviolet:</u> Emitted by the sun and UV bulbs; Responsible for triggering skin to produce melanin and tan/burn; used to kill germs (nail salons use them to sanitize equipment they look like toaster ovens that glow purple. Also, the goggle cabinet in the back of this room uses UV light)
- <u>X-rays:</u> Emitted by electrons outside the nucleus. Dangerous in large doses, but the *preventative* health benefits of limited exposure outweigh the cons of not using X-rays. Used in the medical field for imaging and to fight cancer (radiation therapy). Nuclear reactions inside the sun (as well as many other stars) produce X-rays, too.
- Gamma Rays: Emitted by the nucleus. Used to kill living cells, making it a tool in fighting some types cancer (radiation therapy). However, can also be very dangerous to human health usually when you hear stories of nuclear meltdowns causing radiation poisonings/deaths, it comes from this type of radiation. Nuclear reactions inside the sun (as well as many other stars) produce gamma rays, too.

20.	True or false: High frequency radiation is always bad. EXPLAIN:
f	Why do you think that EM waves with frequencies ranging from those of visible light to lower frequencies are used in many everyday devices, while the EM waves with frequencies higher than visible light are not used as freely?
