

## Ch. 5.5 Simplify Algebraic Expressions

Objective: To simplify algebraic expressions.

$$-4x + 12 + x$$

↑      ↑      ↗  
constant.  
like terms.

Ex. 1: Identify the terms, like terms, coefficients, and constants in the expression  $6n - 7n - 4 + n$ .

$$6n + (-7n) + (-4) + n$$

Terms:  $6n, -7n, -4, n$   
Like terms:  $6n, -7n, n$   
Coefficients:  $6, -7, 1$   
Constant:  $-4$

Ex. 2 Write  $7x - 2 - 7x + 6$  in simplest form.

$$\begin{aligned}7x - 2 - 7x + 6 &= 7x + (-2) + (-7x) + 6 \\&= 7x + (-7x) + (-2) + 6 \\&= 0x + 4 \\&= 4\end{aligned}$$

Ex. 3 The cost of a jacket  $j$  after a 5% markup can be represented by the expression  $j + 0.05j$ . Simplify the expression. Then determine the total cost of the jacket after the markup, if the original price, \$35.

$$\begin{aligned} j + 0.05j &= 1j + 0.05j \\ &= 1.00j + 0.05j \\ &= \boxed{1.05j} \end{aligned}$$

$$1.05(35) = \boxed{\$36.75}$$

$$a + (p -) + (n) - + n\tau =$$

$$\begin{aligned} a + p - n\tau - (n\tau) &= a + p - n\tau \\ a + p\tau - (n\tau) &= a + p - n\tau \\ (p - n) \tau &= a + p - n\tau \\ p - n\tau &= a + p - n\tau \end{aligned}$$

$$a + p - n\tau = a + p - n\tau$$

$$\begin{aligned} a + (x) - 1 + (x) + 2\tau - x\tau &= a + x\tau - 1 + x\tau \\ a + (x - 1) + 2\tau - x\tau &= \\ x + 2\tau - x\tau &= \\ 2\tau &= \end{aligned}$$
