

Learning Focus—Investigating the Relative Position of Numbers 1 to 10

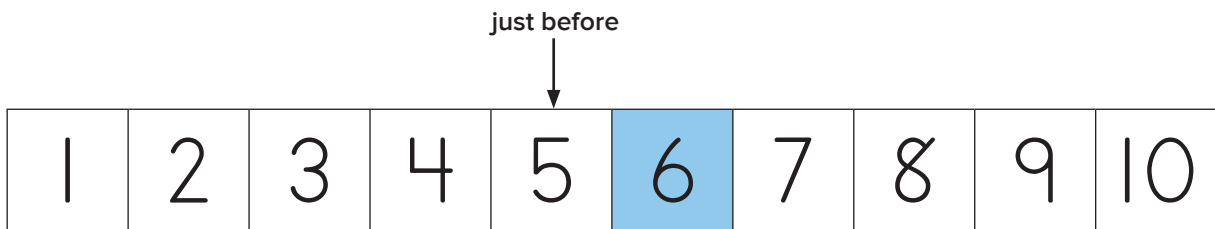

This module gives your child experiences with identifying numbers that are just before and just after a given number in the counting order.

Identify and say a number that comes just before or just after a given number up to 10

In order to reinforce the symbolic representations of numbers (numerals) in the counting order, children are introduced to the number track. A number track is a visual tool, similar to but not the same as a number line, to help illustrate the positions of numbers in counting order, and the relationships between them. In this module, children are asked to find numbers that come just before or just after a specific number.

The number 7 is just after the number 6.

The number 5 is just before the number 6.

Line your child's favorite toys up in a row. Ask your child to find the toy that is just before or just after the toy you choose. You can do the same thing at meal times by lining items of food on a plate.

When your child is cleaning their room, ask them to place their shoes in a row on the floor. Ask them to find a pair of shoes that is just before or just after the shoes you name.
